Business Master Guide

Selling & Delivering the AI Gym System
to Multiple Gyms

Premium AI Gym Membership & Booking Automation
South Africa Market • CPA / POPIA aware
Generated 28 September 2026

1. How You Sell This — The Model

Your system is single-tenant: one Supabase database + one Vercel deployment per gym. You are not building one website that many gyms log into — you stamp out a private, isolated copy for each gym from one master codebase. Each gym's data never mixes with another's.

This is the ideal model for selling, because you already have the tools to spin up a new gym fast: db/schema.sql, the seed scripts (seed:owner, seed:catalog), and an admin Settings panel for branding and pricing — no code editing per gym.

Core principle

Build once. Deploy many. Maintain centrally. One bug fix or new feature pushed to GitHub redeploys every gym automatically.

What you are actually selling (the feature set)

Knowing the full feature list helps you price and pitch with confidence:

- QR + guided registration: personal details, PAR-Q health screening, plan choice, indemnity, Paystack payment, instant membership number + ID card PDF.
- Member portal: check-in, class booking + waitlists, history, membership card/QR, and online payment of any outstanding balance.
- Biometric access: face scan (multi-reading, reliable) + QR + typed-code identification at the door, with visit timers and attendance.
- Staff & trainers: register with a face scan + photo; each gets a login, ID card + PDF, and a verify QR.
- Admin dashboard: verification, members, payments (auto-billing + cash/EFT + CSV), classes, trainers, calendar, analytics (busiest hours, churn), bulk email.
- Corporate-grade: role-based staff logins, audit log, dynamic per-gym branding (name/logo/colour from Settings), automated reminders & owner alerts.
- Compliant & safe: POPIA data handling, CPA-aligned contracts, isolated per-gym database, automated backups via GitHub + your hosting.

2. Pricing Strategy

Choose a recurring model

Monthly subscription (recommended)	You keep ownership of the code, host an instance per gym, and charge R750–R2,500/month each. You push updates to all gyms centrally.
One-time license	Sell a copy for a setup fee (R15k–R40k); they own it; you bill support separately. Quick cash, but no recurring income and less control.

Go with subscription. The ROI story sells itself: the system replaces a R8,000–R15,000/month receptionist, so R1,500/month is an easy yes for a gym owner. Twenty gyms at R1,500 is R30,000/month recurring from a single codebase.

Suggested package

Once-off onboarding/setup fee (e.g. R3,500) + monthly subscription (e.g. R1,500) that bundles hosting, updates and support.

3. Money & Data Ownership (Critical for SA)

For each gym, set these up under the GYM'S OWN accounts, not yours:

- Paystack — the gym's own account. Member payments must flow to them. You only paste their API keys into their instance, so you never handle their members' money or carry financial liability.
- Supabase — ideally the gym's own project for clean data isolation and POPIA. You can manage it on their behalf.
- POPIA — the gym is the "responsible party" for member data; you are the operator/processor. Include a one-page data-processing clause in your contract.

What you keep and control: the GitHub codebase, the deployment process, and (once added) a single Anthropic AI key.

4. Hosting & Costs

Bundle Supabase + Vercel + (later) Anthropic into your monthly fee. Both Supabase and Vercel have free tiers that cover a small gym; upgrade only busy gyms and pass that cost through. The gym sees one simple monthly fee — "everything included".

5. Per-Buyer Delivery Runbook (~1–2 hrs)

Run this every time you land a buyer. Most of it already exists in your DELIVERY.md.

1. Collect from the gym: logo, brand colour, address/contact, operating hours, their plans & prices, their Paystack keys, Brevo sender email, owner WhatsApp number.
2. Database: create a new Supabase project! `run db/schema.sql` in the S seed:owner" and "npm run seed:catalog".
3. Deploy: Vercel! New Project! import your GitHub repo! set environm .env.example)! Deploy. One repo, many Vercel projects.
4. Domain: give them a subdomain (theirgym.yourbrand.co.za) or connect their own domain.
5. Configure in-app: log into /admin! Settings! gym profile, branding, p code needed.
6. QR codes: Admin! QR Codes! download and print their two codes (ne member).
7. Handover: give the owner their /admin login, a 30-minute training call, and a 1-page how-to sheet.
8. Verify: open `https://theirdomain/api/health!` {"status":"ok"} and run t

6. Set Up Before Your First Sale

- A simple contract/SLA: what's included, monthly fee, uptime expectation, support hours, POPIA data clause, cancellation terms.
- An onboarding intake form (a Google Form is fine) that collects everything in step 1 above.
- A support channel (WhatsApp/email) with clear response-time expectations.
- Migrations discipline: when you change the database, add numbered migration files in db/ so you can safely update every existing gym.

Marketing honesty

Until you add the Anthropic key, market it as a "smart guided registration & booking system", not an "AI chatbot" — the conversation is currently rule-based. Add the key, upgrade everyone, then sell the AI angle.

7. One Codebase, Many Gyms

Fix a bug or add a feature once! push to GitHub main! every gym's Vercel is the entire advantage of the single-tenant-from-one-repo model: build once, deploy many, maintain

centrally.

8. Quick Launch Checklist

- ☐ Decide pricing (recurring subscription recommended)
- ☐ Prepare contract/SLA + POPIA data clause
- ☐ Create onboarding intake form
- ☐ Set up your support channel
- ☐ Confirm your GitHub repo is the single source of truth
- ☐ Per gym: their Paystack + Supabase + Brevo accounts
- ☐ Per gym: deploy, configure Settings, generate QR codes
- ☐ Per gym: train the owner + hand over /admin login
- ☐ Per gym: verify /api/health and run the test checklist
